

UNDERSTANDING HPV VACCINATION UPTAKE IN NIGERIA

Analysis of Determinants and Regional Trends

Prepared for Public Health Stakeholders | June 2026

The HPV Challenge

Public Health Impact

Human Papillomavirus (HPV) is the primary driver of cervical cancer, posing a significant threat to women's health in Nigeria.

National Strategy

The Nigerian National HPV Vaccination Program targets girls aged **9-14** to ensure early protection.

Analysis Objectives

Identifying the socioeconomic and geographic determinants that influence vaccine uptake and completion.

Evidence-Based Policy

Using data-driven insights to refine public health interventions and bridge the gap in healthcare delivery.

Dataset Snapshot

4,600

TOTAL RESPONDENTS

Comprehensive survey data collected across multiple Nigerian states and geographic regions.

100%

FEMALE FOCUS

Data specifically targeted at girls aged 9-14, the primary group for HPV vaccination.

28

KEY VARIABLES

Includes demographics, awareness levels, knowledge scores, and accessibility metrics.

9-14

TARGET AGE

Aligns with the Nigerian National HPV Vaccination Program's clinical priorities.

Current Vaccination Landscape

39.4%

FULL COVERAGE

Respondents who have completed the full recommended dosage of the HPV vaccine.

38.7%

PARTIAL UPTAKE

Significant portion of the population has started but not yet completed the series.

21.9%

UNVACCINATED

Critical target group for future outreach and awareness interventions.

Regional Disparities

GEOGRAPHIC VARIANCE

Vaccination rates show significant variation across Nigeria's **Northern and Southern** regions, reflecting localized health infrastructure challenges.

STRATEGIC FOCUS

Northern regions exhibit higher initial uptake, while Southern states require targeted interventions to improve overall coverage and awareness.

The Power of Knowledge

KEY CORRELATION

Higher **Knowledge Scores** (0-10) are directly associated with full vaccination completion.

THE GAP

The "Not Vaccinated" group consistently shows lower median knowledge scores, highlighting a critical education gap.

STRATEGIC FOCUS

Targeted educational interventions are essential to convert awareness into clinical action.

Awareness Drives Willingness

HIGH AWARENESS IMPACT

Parents with **High Awareness** levels show a significantly higher propensity to vaccinate their children, directly correlating with program success.

THE HESITANCY GAP

Willingness to vaccinate drops sharply in households with **Low Awareness**, highlighting a critical need for targeted information dissemination.

STRATEGIC INSIGHT

Community-based awareness campaigns are not just supplementary; they are the **primary catalyst** for increasing national vaccination rates.

Accessibility Barriers

SCORE DISTRIBUTION

Accessibility scores vary widely across the population, indicating significant disparities in healthcare reach.

PHYSICAL DISTANCE

Distance to health facilities remains a primary barrier, particularly in rural and underserved regions.

Strategic Improvement: Mobile clinics and community outreach are vital to bridge the accessibility gap.

Conclusion & Recommendations

KEY FINDINGS

Knowledge Gap

Higher knowledge scores are the strongest predictor of full vaccination completion among the target demographic.

Regional Variance

Significant disparities exist between Northern and Southern regions, driven by local awareness and infrastructure.

Awareness Catalyst

Parental awareness is the primary driver of willingness, yet remains inconsistent across rural populations.

STRATEGIC ACTIONS

Targeted Education

Deploy community-led educational campaigns to debunk myths and improve baseline knowledge scores.

Infrastructure Support

Implement mobile clinics and outreach programs to bridge the physical accessibility gap in rural areas.

Completion Focus

Develop follow-up systems to ensure "Partial" vaccinations are converted to "Full" coverage through reminders.

THANK YOU!

Questions & Discussion

Humanizing health data for a better future.
